

Quantum Theory, MAS 217, Spring 2005

A

0. Motivation (1)

- 0.1. The Newtonian universe (1)
- 0.2. Crisis in classical physics (3)

1. An outline of Hamiltonian classical mechanics (4)

- 1.1. Motion of a particle in one dimension (4)
- 1.2. Motion of a particle in three dimensions (5)
- 1.3. General Hamiltonian system (7)
- 1.4. Energy conservation in Hamiltonian systems (9)
- 1.5. Poisson brackets (13)
- 1.6. Conserved variables (14)

2. The beginning of QM (17)

- 2.1. Particle nature of light (17)
- 2.2. Wave nature of particles (19)
- 2.3. Stability of atoms (22)
- 2.4. The Schrödinger equation (23)
 - 2.4.1. Heuristic derivation (24)
 - 2.4.2. Analysing the ingredients of the SE (25)
 - 2.4.3. Stationary states (29)
 - 2.4.4. Application of the SE: Step potential (31)

3. The mathematical formulation of QM (37)

- 3.1. Postulates of QM (38)
- 3.2. Linear vector spaces (41)
- 3.3. Scalar product (43)

- 3.4. Norm and basis (45)
- 3.5. Hilbert space (48)
- 3.6. Linear and Hermitian operators (49)
- 3.7. Eigenvalue problem of linear operators (52)
- 3.8. Expectation value (56)
- 3.9. Dispersion (58)
- 3.10. Commutators of operators (62)
- 3.11. The probability for measuring an observable (65)
- 3.12. The general form of the uncertainty principle (68)
- 3.13. Ehrenfest's Theorem (71)

4. Applications of QM (74)

- 4.1. The harmonic oscillator (74)
 - 4.1.1. Review: classical case (74)
 - 4.1.2. QM: solving the time-independent Schrödinger equation (74)
- 4.1b. Operator algebra (78)
- 4.2. Angular momentum (80)
 - 4.2.1. Basic commutators (80)
 - 4.2.2. Eigenvalues of angular momentum operators (83)
 - 4.2.3. Orbital angular momentum in spherical coordinates (87)
- 4.3. The Hydrogen atom (89)
